Residential and Commercial Water Filters

A wide variety of Water Filters are available to remove various contaminants found in water. The specific type of filter required depends, of course, on the types and amounts of impurities present.

Activated Carbon

An Activated Carbon Filter may be used for a variety of water-treatment applications requiring the removal of chlorine, taste, odor, and color. Activated carbon is a form of charcoal with high adsorptive qualities.

Birm

A Birm Filter is an efficient and economical method commonly used for the removal of iron and/or manganese from well water supplies. Birm is a granular filter media.

Manganese Greensand

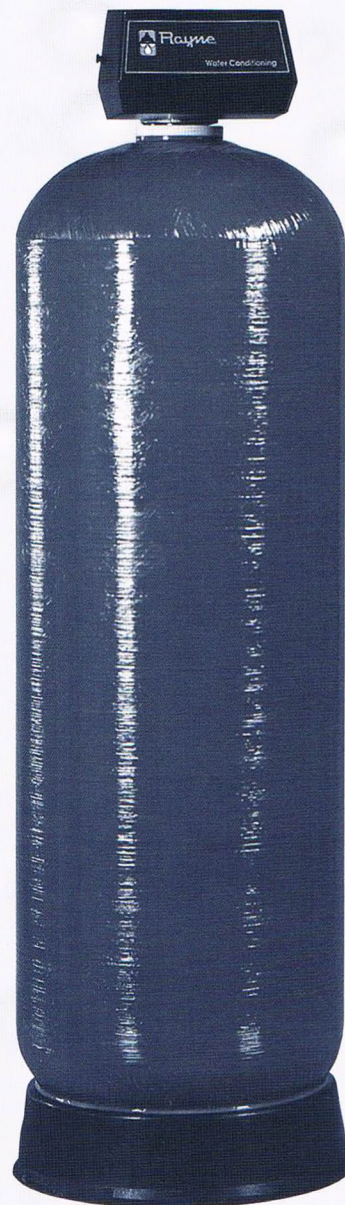

The Manganese Greensand Filter is capable of removing iron, manganese, and hydrogen sulfide from water through oxidation and filtration.

Neutralizing

A blend of filtration media used to neutralize acidic water conditions and reduce corrosive tendencies in certain waters.

Multi-Media

The unique multi-layered feature has advantages over conventional filter beds. It is able to filter as low as 10 micron and to contain substantially more sediment before pressure drop indicates that backwashing is necessary.
